Custom StreetPrint Template Design Parameters

StreetPrint designs can range from traditional brick patterns to custom motifs and logos. Their installation and manufacturing processes can place some limitations not only on what can or cannot be done, but what looks aesthetically pleasing as well. Manufacturing and installation considerations should be taken into account when thinking about using custom StreetPrint templates

The templates are constructed of 3/8" swages wire rope pieces welded together to create a pattern

The spacing between the welds should be a minimum of 3" (76mm) apart and a maximum of 12" (305mm) apart.

When welds are closer or spanning farther than recommended, a number of problems can occur; Welding difficulties, dense and heavy templates or flimsy non-rigid templates

Template Sizing & Pattern

Template Size - For production and application, template size is important for on-site handling. The recommended size for a template is about 9' x 6' (2.7m x 1.8m).

Pattern Consideration - Repeatability and interlock - It is ideal to create repeatable, mirrored and/or overlapping patterns within the 9' x 6' (2.7m x 1.8m recommended template size. This provides ideal flexibility to the applicator in the field and limits confusion and application mistakes.
